

What Is A Number Sentence In Math

Unveiling the Power of Number Sentences in Mathematics

Mathematics is a language, and number sentences are its fundamental building blocks. From simple addition problems to complex algebraic equations, these sentences express mathematical relationships and allow us to solve for unknowns. This will delve into the world of number sentences, exploring their definitions, different types, real-world applications, and the crucial role they play in developing mathematical understanding.

Understanding the Basics: Defining a Number Sentence

A number sentence in mathematics is a statement that shows the relationship between numbers and mathematical operations. It essentially translates a word problem or a mathematical concept into a symbolic representation. This representation uses numbers, operators (like $+$, $-$, $\times$, $\div$), and sometimes variables (like 'x' or 'y') to describe a specific mathematical situation. Crucially, a number sentence **makes a claim** about the equality or inequality of quantities. For example, " $2 + 3 = 5$ " is a number sentence asserting that the sum of 2 and 3 equals 5.

Types of Number Sentences: Beyond the Basics

While the most common form is a simple equation, there's a wider range of number sentences:

1. Equations:

Equations state that two expressions are equal. They typically involve variables that represent unknown values. Solving an equation means finding the value of the variable that makes the equation true.

Example: $2x + 5 = 11$

2. Inequalities:

Inequalities describe relationships where quantities are not equal. They use symbols like $>$ (greater than), $<$ (less than), $\geq$ (greater than or equal to), and $\leq$ (less than or equal to).

Example: $x > 10$ (meaning x is greater than 10)

3. Open Sentences:

These sentences contain variables and can be either equations or inequalities. They are not considered true or false until the variables are replaced with specific values.

Example: $y - 7 = ?$

Building Blocks: Mathematical Operations in Number Sentences

Number sentences rely heavily on various mathematical operations. Understanding these operations is crucial for interpreting and constructing correct number sentences.

1. Addition (+):

Combining two or more values to obtain a total.

Example: $4 + 6 = 10$

2. Subtraction (-):

Finding the difference between two values.

Example: $12 - 5 = 7$

3. Multiplication ($\times$ or $*$):

Repeated addition of a value.

Example: $3 \times 4 = 12$

4. Division ($\div$ or $/$):

Finding how many times one value is contained within another.

Example: $20 \div 5 = 4$

Real-World Applications of Number Sentences

Number sentences aren't just theoretical concepts. They are integral to numerous real-world scenarios:

1. Budgeting and Finance:

Tracking income, expenses, and savings.

Example: If Sarah earns \$150 a week and spends \$80, how much does she save? ($\$150 - \$80 = \$70$)

2. Measurement and Geometry:

Calculating areas, volumes, and distances.

Example: A rectangle has a length of 10cm and a width of 5cm. What is its area? ($10\text{cm} \times 5\text{cm} = 50\text{cm}^2$)

3. Data Analysis:

Calculating averages, finding percentages, and interpreting data.

What is a Number Sentence in Math? Unpacking the Building Blocks of Equations

Ever felt a pang of confusion when you hear the term "number sentence" in math? It's a phrase that pops up surprisingly often, especially in elementary education, and for good reason. Think of it as the foundational language of mathematics, the simple yet powerful way we express mathematical ideas. It's more than just a string of numbers; it's a statement that uses mathematical symbols to show a relationship between quantities. In essence, a number sentence is a mathematical statement that contains numbers, operation symbols, and an equals sign. It's like a complete thought in the world of math, telling us that one side of the equation is equivalent to the other. For instance, " $2 + 3 = 5$ " is a classic example of a number sentence. It's a clear, concise declaration of equality. Understanding what a number sentence is, and how to construct and interpret them, is crucial for building a strong foundation in arithmetic and progressing to more complex mathematical concepts. Let's dive deeper into the world of number sentences and explore what makes them tick. We'll look at their components, their purpose, and why they are such an indispensable part of learning math.

Deconstructing the Number Sentence: The Essential Components

Every number sentence, no matter how simple or complex, is built from a few core elements. Recognizing these parts is key to understanding the meaning of any mathematical statement.

Numbers (or Numerals): The Quantities at Play

The most obvious components of a number sentence are, well, the numbers themselves! These can be whole numbers, fractions, decimals, or even variables (which we'll touch on later). They represent the quantities we are working with. In " $7 - 4 = 3$," the numbers are 7, 4, and 3. They tell us how many items we have, how many we're taking away, and the result. The precision of these numerals is paramount in mathematics; even a slight miscalculation can lead to a different truth.

Operation Symbols: The Actions of Math

Operation symbols are the verbs of our mathematical sentences. They tell us what to do with the numbers. The most common operation symbols include:

- Addition (+):** Represents combining quantities. "Two apples plus three apples makes five apples."
- Subtraction (-):** Represents taking away or finding the difference between quantities. "Seven cookies minus four cookies leaves three cookies."
- Multiplication ($\times$ or $*$):** Represents repeated addition or scaling. "Three groups of five pencils means fifteen pencils in total."
- Division ($\div$ or $/$):** Represents splitting a quantity into equal parts or finding how many times one quantity fits into another. "Ten candies divided equally among five friends means each friend gets two candies."

Beyond these four basic operations, you might also encounter:

- Equality Sign (=):** This is the cornerstone of a number sentence. It asserts that the expression on the left side of the symbol has the same value as the expression on the right side. It's the ultimate declaration of balance.
- Inequality Signs ($<$, $>$, $\leq$, $\geq$):** While not strictly part of *all* number sentences (as they don't always express equality), these symbols are closely related and are used to show that one quantity is greater than, less than, greater than or equal to, or less than or equal to another. For example, " $5 + 2 > 6$ " is a true statement, though it's more accurately an inequality than a strict number sentence.

The Equals Sign (=): The Seal of Equivalence

As mentioned, the equals sign is critical. It's the pivot point of the number sentence. It signifies that the value or expression on the left side is *equal to* the value or expression on the right side. It's the mathematical equivalent of saying "is the same as." Without the equals sign, it's just a collection of numbers and operations, not a complete mathematical statement.

The Purpose of Number Sentences: Why They Matter

You might be thinking, "Why bother with 'number sentence'? Can't we just call them equations?" While they are indeed very similar to equations, especially in elementary math, the term "number sentence" often emphasizes the *statement* aspect and the conceptual understanding of mathematical relationships.

Building Foundational Understanding

For young learners, number sentences are a powerful tool for developing a concrete understanding of mathematical operations and their outcomes. Instead of just memorizing facts, they can see the relationship between numbers and operations. For example, seeing " $2 + 3 = 5$ " helps a child understand that combining two and three results in five. This conceptual grasp is far more valuable than rote memorization.

Problem-Solving Skills

Number sentences are the direct translation of word problems into a mathematical format. If a word problem states, "Sarah had 5 apples and ate 2, how many are left?", the corresponding number sentence would be " $5 - 2 = ?$ ". This process of translating words into symbols and then solving the sentence is a fundamental problem-solving skill. It teaches students how to break down information and represent it mathematically.

Logical Reasoning and Critical Thinking

Constructing and evaluating number sentences fosters logical reasoning. Students learn to think about the relationship between quantities and how operations affect them. They also develop critical thinking skills as they learn to determine if a given number sentence is true or false. For instance, " $4 + 1 = 6$ " is a false number sentence, and understanding *why* it's false is a crucial step in mathematical comprehension.

Introducing Variables and Algebra

As students progress, the concept of the number sentence naturally evolves into algebraic equations. A missing number can be represented by a symbol or a letter, like "x". So, " $5 - 2 = ?$ " becomes " $5 - 2 = x$ ". This is the gateway to algebra, where letters are used to represent unknown quantities. The familiar structure of a number sentence provides a comfortable stepping stone into the more abstract world of algebra.

Types of Number Sentences

While the core concept remains the same, number sentences can vary in their complexity and what they represent.

True Number Sentences

These are statements where the equality holds true. * Example: " $6 + 3 = 9$ "

False Number Sentences

These are statements where the equality does not hold true. * Example: " $10 - 5 = 4$ "

Open Number Sentences (or Equations with Unknowns)

These are number sentences that contain a missing value, typically represented by a symbol or a letter (a variable). The goal is to find the value that makes the sentence true. * Example: $7 + \square = 12$ * Example: $15 \div 3 = y$ These open number sentences are the direct precursors to algebraic equations. Solving them involves finding the unknown, which is a fundamental algebraic skill.

Number Sentences vs. Equations vs. Expressions

It's important to distinguish between number sentences and closely related mathematical terms.

Number Sentence

A complete mathematical statement that includes numbers, operation symbols, and an equals sign, asserting the equality of two expressions. It can be true, false, or open (containing an unknown). * Examples: $3 + 4 = 7$, $2 * 5 = 8$, $9 - \square = 3$

Equation

In elementary math, "number sentence" and "equation" are often used interchangeably. However, in higher mathematics, an equation is generally a statement that asserts the equality of two expressions, and it *always* contains an equals sign. Number sentences can sometimes be used to describe statements that aren't strictly algebraic equations (though this distinction is often subtle). * Examples: $2x + 5 = 11$, $y = 3x - 2$

Expression

An expression is a combination of numbers, variables, and operation symbols that represents a value. Crucially, an expression does *not* contain an equals sign. It's like a phrase rather than a complete sentence. * Examples: $3 + 4$, $2x - 5$, $10 / 2$ Think of it this way: * $3 + 4$ is an **expression**. * $3 + 4 = 7$ is a **number sentence** (and an equation). * $3 + 4 = 8$ is a **false number sentence** (and a false equation). * $3 + x = 7$ is an **open number sentence** (and an algebraic equation).

Putting It All Together: Examples in Action

Let's look at a few more examples to solidify our understanding. * **Word Problem:** John has 5 blue marbles and 3 red marbles. How many marbles does he have in total? * **Number Sentence:** $5 + 3 = 8$ * This number sentence shows the operation (addition) and the result of combining the two quantities. * **Word Problem:** There are 12 cookies, and you want to share them equally among 4 friends. How many cookies does each friend get? * **Number Sentence:** $12 \div 4 = 3$ * This number sentence represents the division of the cookies. * **Word Problem:** If you start with 10 stickers and give some away, you have 6 left. How many did you give away? * **Number Sentence:** $10 - \square = 6$ * This is an open number sentence. The missing number ($\square$) represents the unknown quantity of stickers given away. To solve it, you'd ask yourself, "What number subtracted from 10 equals 6?" The answer is 4.

The Journey Continues: From Number Sentences to Advanced Math

The humble number sentence is the bedrock upon which much of mathematics is built. As you move through your mathematical education, you'll encounter more complex statements that share the core DNA of number sentences.

Algebraic Equations: As we've seen, algebraic equations are essentially open number sentences where letters stand in for unknown values. Understanding how to solve $5 - 2 = ?$ naturally leads to solving $5 - x = 2$.

Inequalities: While not always about strict equality, inequalities (like $x > 5$) are statements about the relationship between quantities, just like number sentences.

Functions: The concept of input and output, fundamental to functions (like $f(x) = 2x + 1$), can be thought of as a more sophisticated form of a number sentence, where a rule is applied to a number to get a result. In conclusion, a number sentence is a vital tool for communicating mathematical ideas. It's a statement of equality that uses numbers and operation symbols to express a relationship between quantities. From understanding basic arithmetic to paving the way for advanced algebra, the simple yet profound concept of the number sentence is an indispensable part of every mathematician's journey. So, the next time you see a string of numbers with operations and an equals sign, remember you're looking at a complete mathematical thought – a number sentence! It's the language that helps us describe, understand, and solve the quantitative puzzles of our world.

Understanding What a Number Sentence Is in Mathematics A number sentence in mathematics is a fundamental expression that involves one or more numerical values combined through basic operations such as addition, subtraction, multiplication, or division. At its core, a number sentence represents a mathematical relationship or calculation, typically structured to yield a specific value or set of values. Unlike equations or inequalities, which may contain unknowns or expressions, a number sentence centers exclusively on numerical quantities and their operations, making it a clear and direct tool for computation and reasoning.

The Essence and Structure of a Number Sentence

At its most basic level, a number sentence takes the form of a statement where numbers are connected by operators. For example, $5 + 3 = 8$ or $12 \div 4 = 3$ serve as simple yet powerful illustrations. These sentences are not only about arriving at a correct answer but also about understanding the relationship between the numbers involved. The structure is straightforward: two or more numbers on either side of an operator, bound by an equal sign to denote equivalence, though not all number sentences include this sign—context determines whether equality, comparison, or operation alone is intended. This simplicity allows learners to build confidence early while laying the groundwork for more complex mathematical expressions.

Key Insights and Mathematical Significance

Number sentences play a crucial role in developing number sense—the intuitive understanding of how numbers relate, compare, and combine. By repeatedly engaging with number sentences, students learn to manipulate numerical values, recognize patterns, and predict outcomes. They serve as building blocks for algebraic thinking, where variables eventually replace fixed numbers, but the logic of operations

remains rooted in number sentences. Additionally, number sentences bridge arithmetic and algebra, demonstrating how fixed calculations evolve into general rules. This transition is vital for mastering higher-level math, where abstract reasoning replaces concrete computation. Beyond computation, number sentences enhance problem-solving skills. They train the mind to parse information, isolate relevant data, and apply logical steps—skills transferable to real-world scenarios involving budgeting, measurements, or data analysis. Their clarity and precision also make them indispensable tools in standardized testing, where accurate interpretation of numerical relationships is essential.

Practical Applications in Everyday and Academic Contexts

In daily life, number sentences appear constantly, often unconsciously. When calculating a grocery bill, determining travel time, or splitting a bill among friends, individuals routinely solve number sentences. For example, figuring that "20 minutes per mile $\times$ 3 miles = 60 minutes" involves a multiplication within a number sentence framework. In academic settings, teachers use number sentences to introduce foundational skills, from simple addition to multi-step word problems that combine several operations. They appear in science, economics, and engineering, where precise calculations underpin experiments, forecasts, and design. Educators leverage number sentences to scaffold learning, starting with straightforward expressions and gradually incorporating variables and multi-step processes. This progression helps students develop fluency and confidence. Moreover, digital tools and interactive platforms now embed number sentences in gamified learning environments, reinforcing engagement and mastery.

Benefits of Mastering Number Sentences

Mastering number sentences offers enduring cognitive and practical benefits. They strengthen mental arithmetic, enabling faster, more accurate calculations without reliance on calculators. This fluency supports mental math skills critical in time-sensitive situations and enhances overall numerical confidence. Furthermore, they cultivate logical reasoning and precision—essential traits in academic achievement and professional success. The pattern recognition and systematic thinking fostered by number sentences also support development in other disciplines, such as coding, statistics, and scientific analysis. By internalizing the logic of number sentences, learners gain a robust foundation for lifelong mathematical competence, empowering them to navigate an increasingly data-driven world with clarity and assurance.

The Future of Number Sentences in Evolving Education

As education continues to evolve, number sentences remain a timeless cornerstone. While technology introduces new ways to compute, the conceptual understanding they provide—how numbers interact, combine, and balance—remains irreplaceable. Future learning environments will likely integrate number sentences into adaptive, personalized experiences, where AI-driven platforms tailor challenges to individual progress. Yet, regardless of the tools, the core principle endures: a number sentence is more than a calculation—it is a gateway to logical thinking, problem-solving, and mathematical fluency that shapes how we understand and interact with the world.

What is a Number Sentence in Math? Unpacking the Building Blocks of Mathematical Expression

In the vast and intricate world of mathematics, clarity and precision are paramount. Before delving into complex equations and abstract theories, students embark on a journey that begins with the most fundamental building blocks of mathematical expression. One such foundational concept is the **number sentence**. While seemingly simple, understanding what a number sentence is and how it functions is crucial for developing a strong mathematical foundation. This article will delve deep into the definition, components, types, and importance of number sentences, providing a comprehensive, SEO-friendly exploration for learners of all ages and educators alike.

Defining the Number Sentence: More Than Just Numbers

At its core, a **number sentence** is a mathematical statement that compares two expressions. It's a complete thought in mathematics, much like a sentence in language. It contains numbers, mathematical symbols (like $+$, $-$, $\times$, $\div$, $=$, $<$, $>$), and often words or symbols representing unknown values. The primary purpose of a number sentence is to express a relationship between mathematical quantities.

Think of it as a declaration of equality or inequality. It asserts that what is on one side of a comparison symbol is either the same as, greater than, or less than what is on the other side. This fundamental concept is often introduced early in a child's mathematical education, typically in elementary school, to help them grasp basic arithmetic operations and the logic of mathematical reasoning.

Key elements that distinguish a number sentence include:

1. **Numbers:** The numerical values involved in the statement.
2. **Operations:** The mathematical actions (addition, subtraction, multiplication, division) to be performed.
3. **Equality or Inequality Symbols:** The core of the sentence, indicating the relationship between expressions (e.g., $=$, $\neq$, $<$, $>$, $\leq$, $\geq$).
4. **Unknowns (Optional):** Often represented by a box, a blank space, or a letter (like 'x'), signifying a value that needs to be found.

The Anatomy of a Number Sentence: Breaking Down the Components

To truly understand what a number sentence is, we must dissect its essential components. Each part plays a vital role in conveying meaning and guiding mathematical problem-solving.

1. Numbers and Variables: The Quantifiable Elements

These are the concrete or abstract values within the sentence. Numbers are familiar digits, while variables (often represented by letters like x , y , or even a blank space) stand for unknown quantities. The presence of a variable transforms a simple statement into an equation or inequality that requires solving.

2. Mathematical Operations: The Actions Performed

The familiar symbols of arithmetic (+, -, ×, ÷) dictate the calculations that must be performed to evaluate or solve the number sentence. Understanding the order of operations (PEMDAS/BODMAS) becomes critical when dealing with more complex number sentences.

3. Comparison Symbols: The Relationship Declarers

These symbols are the heart of the number sentence, defining the relationship between the expressions on either side. The most common include:

1. **Equals (=):** Indicates that both sides have the same value.
2. **Not Equals (≠):** Indicates that both sides do not have the same value.
3. **Greater Than (>):** Indicates that the expression on the left is larger than the expression on the right.
4. **Less Than (<):** Indicates that the expression on the left is smaller than the expression on the right.
5. **Greater Than or Equal To (≥):** Indicates that the expression on the left is larger than or equal to the expression on the right.
6. **Less Than or Equal To (≤):** Indicates that the expression on the left is smaller than or equal to the expression on the right.

4. Expressions: The Sides of the Statement

An expression is a combination of numbers, variables, and operations that represents a mathematical value. A number sentence essentially compares two such expressions. For example, in " $3 + 5 = 8$ ", " $3 + 5$ " is one expression, and " 8 " is the other.

Types of Number Sentences: A Spectrum of Mathematical Statements

Number sentences can be categorized based on the type of comparison and the presence of unknowns. This differentiation helps in understanding their complexity and the methods required to solve them.

1. True Number Sentences (or True Equations/Inequalities)

These are statements where the comparison symbol correctly reflects the relationship between the expressions. They are already solved and simply state a mathematical fact.

Examples:

1. $2 + 3 = 5$
2. $10 - 4 > 5$
3. $7 \times 2 = 14$

2. False Number Sentences (or False Equations/Inequalities)

These are statements where the comparison symbol incorrectly reflects the relationship between the expressions. They are mathematically incorrect as stated.

Examples:

1. $\$6 + 2 = 7\$$
2. $\$9 - 3 < 2\$$
3. $\$5 \times 3 = 10\$$

3. Open Number Sentences (or Equations/Inequalities with Unknowns)

These are the most common type encountered when learning to solve for unknown values. They contain a variable or a placeholder (like a box or blank) representing a missing number.

Examples:

1. $\$4 + \boxed{?} = 9\$$
2. $\$15 - x = 7\$$
3. $\$3 \times y > 12\$$
4. $\$20 \div \Box = 5\$$

The goal when presented with an open number sentence is to find the value(s) of the unknown that make the sentence true.

The Importance of Number Sentences in Mathematics Education

The humble number sentence is far more than a pedagogical tool for beginners. Its significance permeates various levels of mathematical understanding.

1. Building Foundational Arithmetic Skills

For young learners, number sentences provide a concrete way to practice and internalize basic addition, subtraction, multiplication, and division facts. They move beyond rote memorization to understanding the relationships between numbers and operations.

2. Developing Problem-Solving Strategies

Open number sentences introduce the concept of variables and the process of algebraic thinking. Students learn to analyze a problem, identify the unknown, and devise strategies to find the missing value. This lays the groundwork for more complex algebraic problem-solving.

3. Fostering Logical Reasoning and Critical Thinking

Evaluating the truth or falsity of number sentences sharpens logical reasoning. Students must perform calculations, compare results, and make judgments based on mathematical rules. This critical thinking skill is invaluable across all academic disciplines.

4. Bridging the Gap to Algebra

The transition from arithmetic to algebra is often facilitated by number sentences with unknowns. They

demonstrate that letters can represent numbers and that equations and inequalities are tools for representing and solving relationships.

5. Enhancing Mathematical Communication

Number sentences offer a structured way to express mathematical ideas. Understanding and constructing them improves a student's ability to communicate mathematical thoughts and solutions effectively.

6. Connecting Mathematical Concepts

Number sentences can be used to illustrate various mathematical concepts, such as commutativity ($a+b = b+a$) or the distributive property ($a \times (b+c) = a \times b + a \times c$). They serve as concise representations of these abstract ideas.

Number Sentences in Action: Examples and Applications

Let's look at some practical examples to solidify our understanding:

Simple Addition Sentence:

"Sarah had 3 apples. Her friend gave her 2 more. How many apples does Sarah have now?"

This word problem can be translated into the number sentence: $3 + 2 = \boxed{}$

The solution is $3 + 2 = 5$. The number sentence $3 + 2 = 5$ confirms the answer.

Subtraction Sentence with an Unknown:

"There were 10 birds on a wire. Some flew away, and now there are only 6 left. How many birds flew away?"

The number sentence would be: $10 - \boxed{} = 6$ or $10 - x = 6$.

To solve this, we ask: "What number subtracted from 10 equals 6?" The answer is 4. So, $10 - 4 = 6$. The unknown is 4.

Multiplication and Inequality:

Consider the statement: "A baker made 4 batches of cookies, with 6 cookies in each batch. Is the total number of cookies greater than 20?"

This translates to the number sentence: $4 \times 6 > 20$?

Performing the multiplication: $24 > 20$. This is a **true number sentence** (specifically, a true inequality).

Division and Equality:

"If you have 12 cookies and want to share them equally among 3 friends, how many cookies does each friend get?"

The number sentence is: $12 \div 3 = \boxed{?}$

The solution is $12 \div 3 = 4$. The number sentence $12 \div 3 = 4$ expresses the result.

Common Misconceptions and Clarifications

While fundamental, there are a few points where learners might stumble:

1. **Confusing Expressions and Sentences:** An expression like " $3 + 5$ " is not a number sentence; it's a part of one. A number sentence requires a comparison symbol and a complete statement.
2. **Assuming the Unknown is Always a Question Mark:** Variables can be represented by letters (x, y, a, b) or even blank spaces.
3. **Focusing Solely on Equality:** While the equals sign is common, number sentences also heavily utilize inequality symbols, which are crucial for understanding ranges and comparisons.
4. **Ignoring the "Sentence" Aspect:** Just like linguistic sentences, number sentences must be grammatically (mathematically) correct to convey meaning. A false number sentence is still a statement, but it's an incorrect one.

Conclusion: The Enduring Power of Simple Statements

In conclusion, a **number sentence** is a fundamental mathematical statement that compares two expressions using mathematical symbols. It is a powerful tool for learning basic arithmetic, developing problem-solving skills, fostering logical reasoning, and bridging the gap to more advanced mathematical concepts like algebra. From the simplest arithmetic exercises to the foundational elements of algebraic equations, number sentences provide a clear, concise, and effective way to express and explore mathematical relationships. Understanding what a number sentence is, its components, and its various forms is an indispensable step in mastering the language and logic of mathematics.

5	Why do we even use number sentences in math education?	They're crucial for developing a foundational understanding of mathematical relationships, problem-solving skills, and logical reasoning. They help bridge the gap between concrete objects and abstract mathematical concepts.
6	What are the key components of a number sentence?	A number sentence typically includes numbers, mathematical operations (like $+$, $-$, $\times$, $\div$), and a symbol of relation (usually '=' for equality, but also $<$, $>$, $\leq$, $\geq$).
7	Can number sentences have missing parts, and what do we call those?	Yes! When a number or operation is missing, it's often called an open sentence or an equation with a variable (like ' $x + 3 = 7$ '). Solving it means finding the missing value.
8	How do number sentences help with algebraic thinking?	They introduce the idea of representing unknown quantities with symbols and understanding how different parts of an equation relate to each other, which is the basis of algebra.

9	Are there different types of number sentences, like true or false ones?	Absolutely! A number sentence can be 'true' (like ' $5 > 2$ ') or 'false' (like ' $1 + 1 = 3$ '). This concept helps in evaluating mathematical statements.
10	What's the 'number sentence' concept in everyday life?	Think of budgeting: if you have \$50 and spend \$20, the number sentence could be ' $\$50 - \$20 = \$30$ ' to show your remaining money.
