Questions & Answers About interview questions for windows system administrator

No	Question	Answer
1	Beyond the basics, what are some advanced troubleshooting techniques you employ when a Windows server becomes unresponsive?	I'd start by checking critical services and Event Logs for immediate clues. Then, I'd leverage tools like Resource Monitor to pinpoint resource bottlenecks (CPU, memory, disk I/O). If necessary, I'd utilize Process Explorer to analyze running processes and investigate unusual activity, and consider analyzing memory dumps if the issue is persistent or severe.

2	How do you approach securing Windows Server environments, and what are your go-to security best practices?	My approach involves a layered defense strategy. Key practices include implementing the principle of least privilege, regularly patching systems, configuring strong firewall rules, enabling BitLocker for disk encryption, using Group Policy for centralized security enforcement, and conducting regular security audits and vulnerability scans.
3	Describe your experience with PowerShell scripting. Can you give an example of a task you've automated or could automate?	I have significant experience with PowerShell, using it for automating repetitive tasks and managing Windows environments efficiently. For example, I've written scripts to automate user account creation and modification in Active Directory, bulk software deployment, and generating system health reports. I could also automate server patching by scheduling script execution.
4	When managing Active Directory, what are some common issues you've encountered, and how did you resolve them?	Common issues include replication failures, trust relationship problems, and DNS resolution issues. For replication failures, I'd use 'repadmin' to diagnose and troubleshoot. Trust issues often require re-establishing trusts or verifying DNS. DNS problems are tackled by ensuring correct SRV records and DNS zone health.
5	How do you handle disaster recovery planning and testing for Windows Server infrastructure?	My approach involves establishing clear RTO (Recovery Time Objective) and RPO (Recovery Point Objective) goals. I'd implement backup solutions like Windows Server Backup or third-party tools, ensuring regular backups and offsite storage. Crucially, I'd conduct regular disaster recovery drills and test restore procedures to validate the plan's effectiveness.
6	What's your strategy for performance tuning and optimization on a Windows Server experiencing slow response times?	First, I'd identify the bottleneck using Performance Monitor, analyzing CPU, memory, disk, and network utilization. Based on the findings, I'd investigate specific services or applications consuming resources, optimize database queries, defragment drives (if applicable), adjust network configurations, and ensure adequate hardware resources are allocated.
7	Can you explain the role of Group Policy in managing a Windows domain environment, and what are some effective GPO configurations you've implemented?	Group Policy is essential for centralized management and configuration of user and computer settings. I've implemented GPOs for software deployment, enforcing password policies, restricting user access to certain applications or drives, mapping network drives, and configuring security settings across the domain to ensure consistency and compliance.
